Format the tests

Test 1: Students are **not allowed** to use the Internet or AI, and **work individually**, consists of two questions (time: 50')

Question 1 (5 points): UI code (XML file), as shown in the figure below:

Question 2 (5 points): Handle events, the format is as shown below.

Design and code an app with the following ticket-booking requirements: full name, phone number, ticket type (First Class, Business Class, or Economy Class – select one), number of tickets, discount (%), and a Book Ticket button.

- When the user books a ticket, the user's information will be displayed below, including full name, phone number, total amount, and a RatingBar for selecting a rating.
- The total amount is calculated as:

Total amount = Ticket price × Number of tickets – discount.

- The ticket prices are:
  - First Class: 1,500K
  - Business Class: 1,300K
  - Economy Class: 1,000K
- If the user gives a 5-star rating, an additional 5% discount will be deducted from the total amount.

Test 2: Students are **allowed** to use the Internet, AI, and work **in groups**.

Create a project with the following tables (including table names and attributes) and required functionalities:

- Login: Implement a login function with two roles and provide the corresponding functions for each role.
- Login account storage: Store login account information using SharedPreferences.
- Data storage: Store the tables using SQLite or Room Database.
- Version control and collaboration: Work together and manage the project code using GitHub or GitLab.
- Scoring: The score is based on the time taken to complete the project. The less time a student takes, the higher the score.

Example: The project should have a format similar to the example below:

```
Create a project with the following 4 tables:
Account(id, username, password, role)
Student(id, code, fullname, email, accountId)
Teacher(id, fullname, email, accountId)
Score(id, studentCode, teacherCode, subject, score)
```

Base project (If you choose SQLite:)

```
com.example.studentmanager
│
├── activities
│   ├── LoginActivity.java
│   ├── ScoreActivity.java
│
├── dal
│   └── DBHelper.java
│
```

```
├── models
│   ├── Account.java
│   ├── Student.java
│   |--- Teacher.java
│   └── Score.java
│
└── MainActivity.java
```

Base project (If you choose Room database)

```
com.example.studentmanager
│
├── activities
│   ├── LoginActivity.java
│   ├── ScoreActivity.java
│
├── dal
│   ├── AppDB.java
│   └── DAO.java
│
├── entities
│   ├── Account.java
│   ├── Student.java
│   |-----Teacher.java
│   ├── Score.java
│   └── ScoreView.java
│
└── MainActivity.java
```

Test 3: Students are **allowed** to use the Internet, AI, and work **in groups**.

Create a project based on the given requirements. Students are responsible for analyzing, designing, and implementing the project according to their own ideas.
The deliverables must include:
- a task table (using Excel Online)
- Code management using GitHub or GitLab.
- Scoring: The score is based on the time taken to complete the project. The less time a student takes, the higher the score.

Example of the project requirements: Movie Ticket Booking Application
